Significance
This fine example of early log construction is probably the oldest standing structure in the Harper Farm Complex.
Although log barns and other buildings were common in this area in the nineteenth century, this is one of the relatively few examples that survives intact. See Site AB1304-A for significance of complex.

ļ

Significance
The use of one-half dovetail joinery in constructing frame stalls makes this structure unique. This joinery method was employed in early log construction, but there are no other examples of its use with frame members in the project area, nor has it been documented in the surrounding region. See Site AB1304-A for significance of complex.

١

.

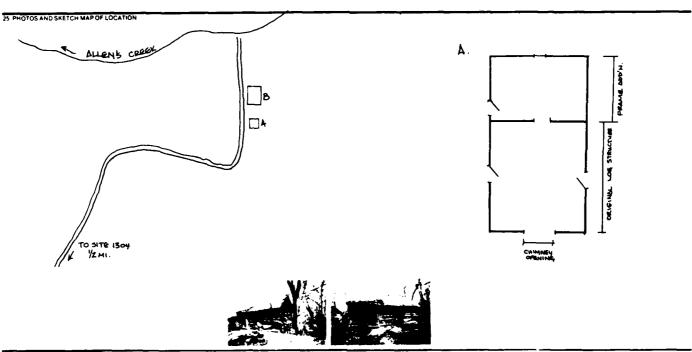

These remains were included in this inventory to lend a sense of completion to the Harper Farm Complex of which ten outbuildings survive. The two chimneys exhibit an unusual construction technique for this region, with a brick relieving arch over the fireplace openings. This is the only known example of this form of brick construction in the project area. See Site AB1304-A for significance of this complex.

•

Significance It is possible that this small one-room log cabin was constructed as a slave quarters or other dependency for the Harper Farm (Site AB1304), and later moved to its present location. The age, size and construction methods of the original structure closely parallel those of site AB1304-3A, which may indicate that the two buildings were related and/or had similar uses. The addition to the log structure and its use for hay storage make it a good example of the ways in which farm structures were adapted to changing needs.

| Structure is a single span, bolt connected Warren pony truss. It is 56'5" long and 21'6" wide and rests on reinforcete abuttments. There are foundations indicating the existence of two early bridges, both of which have been colished.
